1。

Questions 1-2 are about noisy targets.

Consider the bin model for a hypothesis  $h$  that makes an error with probability  $\mu$  in approximating a deterministic target function  $f$  (both  $h$  and  $f$  outputs  $\{-1, +1\}$ ). If we use the same  $h$  to approximate a noisy version of  $f$  given by

$$P(\mathbf{x}, y) = P(\mathbf{x})P(y|\mathbf{x})$$
$$P(y|\mathbf{x}) = \begin{cases} \lambda & y = f(\mathbf{x}) \\ 1 - \lambda & \text{otherwise} \end{cases}$$

What is the probability of error that  $h$  makes in approximating the noisy target  $y$ ?

- ☐  $1 - \lambda$
  - ☐  $\mu$
  - ☐  $\lambda(1 - \mu) + (1 - \lambda)\mu$
  - ☒  $\lambda\mu + (1 - \lambda)(1 - \mu)$
  - ☐ none of the other choices

There are a number of bounds on the generalization error  $\epsilon$ , all holding with probability at least  $1 - \delta$ . Fix  $d_{\text{vc}} = 50$  and  $\delta = 0.05$  and plot these bounds as a function of  $N$ . Which bound is the tightest (smallest) for very large  $N$ , say  $N = 10,000$ ?

Note that Devroye and Parrondo & Van den Broek are implicit bounds in  $\epsilon$ .

- ☐ Original VC bound:  $\epsilon \leq \sqrt{\frac{8}{N} \ln \frac{4m_{\mathcal{H}}(2N)}{\delta}}$
  - ☐ Rademacher Penalty Bound:  
 $\epsilon \leq \sqrt{\frac{2 \ln(2Nm_{\mathcal{H}}(N))}{N}} + \sqrt{\frac{2}{N} \ln \frac{1}{\delta}} + \frac{1}{N}$
  - ☐ Parrondo and Van den Broek:  
 $\epsilon \leq \sqrt{\frac{1}{N} (2\epsilon + \ln \frac{6m_{\mathcal{H}}(2N)}{\delta})}$
  - ☒ Devroye:  $\epsilon \leq \sqrt{\frac{1}{2N} (4\epsilon(1 + \epsilon) + \ln \frac{4m_{\mathcal{H}}(N^2)}{\delta})}$
  - ☐ Variant VC bound:  $\epsilon \leq \sqrt{\frac{16}{N} \ln \frac{2m_{\mathcal{H}}(N)}{\sqrt{\delta}}}$
- 

10  
points

5.

Continuing from Question 4, for small  $N$ , say  $N = 5$ , which bound is the tightest (smallest)?

- ☐ Original VC bound
  - ☐ Rademacher Penalty Bound
  - ☒ Parrondo and Van den Broek
  - ☐ Devroye
  - ☐ Variant VC bound
-

In Questions 6-11, you are asked to play with the growth function or VC-dimension of some hypothesis sets.

What is the growth function  $m_{\mathcal{H}}(N)$  of "positive-and-negative intervals on  $\mathbb{R}$ "? The hypothesis set  $\mathcal{H}$  of "positive-and-negative intervals" contains the functions which are  $+1$  within an interval  $[\ell, r]$  and  $-1$  elsewhere, as well as the functions which are  $-1$  within an interval  $[\ell, r]$  and  $+1$  elsewhere.

For instance, the hypothesis  $h_1(x) = \text{sign}(x(x - 4))$  is a negative interval with  $-1$  within  $[0, 4]$  and  $+1$  elsewhere, and hence belongs to  $\mathcal{H}$ . The hypothesis  $h_2(x) = \text{sign}((x + 1)(x)(x - 1))$  contains two positive intervals in  $[-1, 0]$  and  $[1, \infty)$  and hence does not belong to  $\mathcal{H}$ .

- ☒  $N^2 - N + 2$
- ☐  $N^2$
- ☐  $N^2 + 1$
- ☐ none of the other choices.
- ☐  $N^2 + N + 2$
- 

10  
points

7.

Continuing from the previous problem, what is the VC-dimension of the hypothesis set of "positive-and-negative intervals on  $\mathbb{R}$ "?

- ☒ 3
- ☐ 4
- ☐ 5
- ☐  $\infty$

8.

What is the growth function  $m_{\mathcal{H}}(N)$  of "positive donuts in  $\mathbb{R}^2$ "?

The hypothesis set  $\mathcal{H}$  of "positive donuts" contains hypotheses formed by two concentric circles centered at the origin. In particular, each hypothesis is  $+1$  within a "donut" region of  $a^2 \leq x_1^2 + x_2^2 \leq b^2$  and  $-1$  elsewhere. Without loss of generality, we assume  $0 < a < b < \infty$ .

☐  $N + 1$

☒  $\binom{N+1}{2} + 1$

☐  $\binom{N+1}{3} + 1$

☐ none of the other choices.

☐  $\binom{N}{2} + 1$

10  
points

9.

Consider the "polynomial discriminant" hypothesis set of degree  $D$  on  $\mathbb{R}$ , which is given by

$$\mathcal{H} = \left\{ h_{\mathbf{c}} \mid h_{\mathbf{c}}(x) = \text{sign} \left( \sum_{i=0}^D c_i x^i \right) \right\}$$

What is the VC-dimension of such an  $\mathcal{H}$ ?

## 作業二

测验, 20 个问题

- ☐  $D$   
☒  $D + 1$   
☐  $\infty$   
☐ none of the other choices.  
☐  $D + 2$
- 

10  
points

10.

Consider the "simplified decision trees" hypothesis set on  $\mathbb{R}^d$ , which is given by

$$\mathcal{H} = \{h_{\mathbf{t}, \mathbf{S}} \mid h_{\mathbf{t}, \mathbf{S}}(\mathbf{x}) = 2[\mathbf{v} \in S] - 1, \text{ where } v_i = [[x_i > t_i]],$$

$$\mathbf{S} \text{ a collection of vectors in } \{0, 1\}^d, \mathbf{t} \in \mathbb{R}^d \}$$

That is, each hypothesis makes a prediction by first using the  $d$  thresholds  $t_i$  to locate  $\mathbf{x}$  to be within one of the  $2^d$  hyper-rectangular regions, and looking up  $\mathbf{S}$  to decide whether the region should be  $+1$  or  $-1$ .

What is the VC-dimension of the "simplified decision trees" hypothesis set?

- ☒  $2^d$   
☐  $2^{d+1} - 3$   
☐  $\infty$   
☐ none of the other choices.  
☐  $2^{d+1}$

测验, 20 个问题

For Questions 16-20, you will play with the decision stump algorithm.

In class, we taught about the learning model of "positive and negative rays" (which is simply one-dimensional perceptron) for one-dimensional data. The model contains hypotheses of the form:

$$h_{s,\theta}(x) = s \cdot \text{sign}(x - \theta).$$

The model is frequently named the "decision stump" model and is one of the simplest learning models. As shown in class, for one-dimensional data, the VC dimension of the decision stump model is 2 .

In fact, the decision stump model is one of the few models that we could easily minimize  $E_{in}$  efficiently by enumerating all possible thresholds. In particular, for  $N$  examples, there are at most  $2N$  dichotomies (see page 22 of lecture 5 slides), and thus at most  $2N$  different  $E_{in}$  values. We can then easily choose the dichotomy that leads to the lowest  $E_{in}$ , where ties can be broken by randomly choosing among the lowest  $E_{in}$  ones. The chosen dichotomy stands for a combination of some "spot" (range of  $\theta$ ) and  $s$ , and commonly the median of the range is chosen as the  $\theta$  that realizes the dichotomy.

In this problem, you are asked to implement such an algorithm and run your program on an artificial data set. First of all, start by generating a one-dimensional data by the procedure below:

(a) Generate  $x$  by a uniform distribution in  $[-1, 1]$ .

(b) Generate  $y$  by  $f(x) = \tilde{s}(x) + \text{noise}$  where  $\tilde{s}(x) = \text{sign}(x)$  and the noise flips the result with 20% probability.

For any decision stump  $h_{s,\theta}$  with  $\theta \in [-1, 1]$ , express  $E_{out}(h_{s,\theta})$  as a function of  $\theta$  and  $s$ .

☐  $0.3 + 0.5s(|\theta| - 1)$

☐  $0.3 + 0.5s(1 - |\theta|)$

☒  $0.5 + 0.3s(|\theta| - 1)$

Decision stumps can also work for multi-dimensional data. In particular, each decision stump now deals with a specific dimension  $i$ , as shown below.

$$h_{s,i,\theta}(\mathbf{x}) = s \cdot \text{sign}(x_i - \theta).$$

Implement the following decision stump algorithm for multi-dimensional data:

- for each dimension  $i = 1, 2, \dots, d$ , find the best decision stump  $h_{s,i,\theta}$  using the one-dimensional decision stump algorithm that you have just implemented.
- return the "best of best" decision stump in terms of  $E_{in}$ . If there is a tie, please randomly choose among the lowest- $E_{in}$  ones

The training data  $\mathcal{D}_{train}$  is available at:

[https://www.csie.ntu.edu.tw/~htlin/mooc/datasets/mlfound\\_math/hw2\\_train.dat](https://www.csie.ntu.edu.tw/~htlin/mooc/datasets/mlfound_math/hw2_train.dat)

The testing data  $\mathcal{D}_{test}$  is available at:

[https://www.csie.ntu.edu.tw/~htlin/mooc/datasets/mlfound\\_math/hw2\\_test.dat](https://www.csie.ntu.edu.tw/~htlin/mooc/datasets/mlfound_math/hw2_test.dat)

Run the algorithm on the  $\mathcal{D}_{train}$ . Report the  $E_{in}$  of the optimal decision stump returned by your program. Choose the closest option.
