Vectorization allows you to compute forward propagation in an L -layer neural network without an explicit for-loop (or any other explicit iterative loop) over the layers I=1, 2, ...,L. True/False?

() True

False

正确

Forward propagation propagates the input through the layers, although for shallow networks we may just write all the lines $(a^{[2]}=g^{[2]}(z^{[2]})$, $z^{[2]}=W^{[2]}a^{[1]}+b^{[2]}$, ...) in a deeper network, we cannot avoid a for loop iterating over the layers: $(a^{[l]}=g^{[l]}(z^{[l]})$, $z^{[l]}=W^{[l]}a^{[l-1]}+b^{[l]}$, ...).

5.

Assume we store the values for $n^{[l]}$ in an array called layers, as follows: layer_dims = $[n_x$, 4,3,2,1]. So layer 1 has four hidden units, layer 2 has 3 hidden units and so on. Which of the following for-loops will allow you to initialize the parameters for the model?

```
1 for(i in range(1, len(layer_dims)/2)):
2  parameter['W' + str(i)] = np.random.randn(layers[i], layers[i-1])) * 0.01
3  parameter['b' + str(i)] = np.random.randn(layers[i], 1) * 0.01
```

```
1 for(i in range(1, len(layer_dims)/2)):
2  parameter['W' + str(i)] = np.random.randn(layers[i], layers[i-1])) * 0.01
3  parameter['b' + str(i)] = np.random.randn(layers[i-1], 1) * 0.01
```

```
1 for(i in range(1, len(layer_dims))):
2    parameter['W' + str(i)] = np.random.randn(layers[i-1], layers[i])) * 0.01
3    parameter['b' + str(i)] = np.random.randn(layers[i], 1) * 0.01
```

6.

Consider the following neural network.

How many layers does this network have?

The number of layers L is 4. The number of hidden layers is 3.

Yes. As seen in lecture, the number of layers is counted as the number of hidden layers + 1. The input and output layers are not counted as hidden layers.

- The number of layers L is 3. The number of hidden layers is 3.
- igcup The number of layers L is 4. The number of hidden layers is 4.
- igcap The number of layers L is 5. The number of hidden layers is 4.

7.

During forward propagation, in the forward function for a layer l you need to know what is the activation function in a layer (Sigmoid, tanh, ReLU, etc.). During backpropagation, the corresponding backward function also needs to know what is the activation function for layer l, since the gradient depends on it. True/False?

True

10/10 分 (100%)

Key concept**季** Deep Neural Networks
_{测验, 10} 个问题

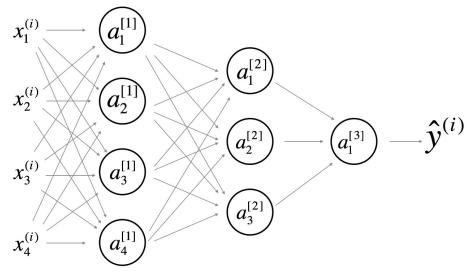

Yes, as you've seen in the week 3 each activation has a different derivative. Thus, during backpropagation you need to know which activation was used in the forward propagation to be able to compute the correct derivative.
